Human-In-The-Loop AI Log Triage Workspace

Securing SOC Workflows with Privacy-First AI Log Analysis

Modern SOC Operational Bottlenecks

Alert Fatigue & Operational Speed

SOC analysts are overwhelmed by high volumes of repetitive security logs, leading to **delayed incident response**.

Fully automated AI tools often generate **false positives** without human validation, compounding analyst burnout and eroding trust in tooling.

Data Leakage & Security Risks

Direct exposure of **Sensitive Data** — PII, IP addresses, internal credentials — when routing raw logs to public Cloud AI APIs.

Without client-side sanitization, every AI query becomes a potential **data exfiltration vector**, violating compliance and privacy mandates.

Secure Human-In-The-Loop AI Workflow

This privacy-first pipeline ensures that no sensitive telemetry ever leaves the client unredacted — AI speed is harnessed without sacrificing analyst control or data sovereignty.

Platform Capabilities & Interface

Key Highlights

Custom Sanitization Presets

Configurable regex rules for instantly scrubbing IPs, tokens, and user credentials.

Real-time Redaction Preview

Side-by-side comparison of raw vs. sanitized log streams.

Threat Severity Cards

Color-coded severity metrics — **Critical, High, Medium** — with structured remediations.

Performance Metrics & Future Vision

QA Validation

15/15

QA Matrix Pass

Successfully passed rigorous test cases covering sanitization edge cases.

0%

Credential Leakage

Verified zero telemetry leakage to external AI endpoints during stress testing.

Future Roadmap

01

SIEM/SOAR Integration

Native integration with major enterprise platforms — **Splunk**, **Microsoft Sentinel**.

02

Automated Playbook Generation

AI-driven playbooks generated from human-confirmed log insights, accelerating response workflows.
